

Cover letter — submission to *Universe* (MDPI)

Manuscript: A Proton–Electron Cosmology: RealQM and Newtonian Gravitation
from a Single Electric-Potential Seed
Author: Claes Johnson, KTH Royal Institute of Technology, Stockholm, Sweden
Type: Article (theoretical / exploratory)
Section: Cosmology

Dear Editors,

I am pleased to submit the manuscript *A Proton–Electron Cosmology: RealQM and Newtonian Gravitation from a Single Electric-Potential Seed* for consideration as an Article in *Universe*.

The paper sets out an exploratory, non-standard cosmological model built from only two well-understood ingredients — electron–proton Coulomb interaction and Newtonian gravitation — with no Big Bang singularity, no inflation, no dark-matter particle, and no cosmological constant. The single primitive is a small-scale fluctuation of the electric potential; charge is its Laplacian, and the two-tier structure of the universe then follows: the Laplacian’s short-wavelength weighting produces a small-scale proton–electron world of nuclei and atoms (the RealQM / RealNucleus program), and the ordinary energy/mass density of that Coulombic matter sources an emergent Newtonian gravitation whose positive and negative curvature sectors separate into the cosmic web and a repulsive (dark-energy-like) component. The model reproduces a helium mass fraction near $Y \approx 0.25$ as a consistency check.

The manuscript is deliberately framed as a proposal, not as established cosmology. It includes an explicit Status note, a section relating the model to Λ CDM and to observations (stating plainly what it does and does not yet address — the redshift–distance relation, the CMB, precise large-scale-structure statistics, and light elements beyond helium), and a candid list of load-bearing open problems, chiefly what sets the nuclear energy scale. What the model offers in exchange for its incompleteness is economy: fewer free primitives than the standard account.

I believe the work fits the scope of *Universe*, which welcomes original and exploratory theoretical contributions to cosmology and foundational physics, including approaches outside the mainstream that are argued carefully and honestly. The paper is self-contained and does not presuppose familiarity with the author’s earlier RealQM and RealNucleus work, which is cited for context.

The manuscript is original, has not been published elsewhere, and is not under consideration by another journal. The author has no competing interests to declare. There are no funding sources to acknowledge and no data sets associated with the work (it is analytical/theoretical; supporting interactive simulations are freely available online and are cited).

Thank you for considering the manuscript. I would be happy to respond to any questions.

Yours sincerely,

Claes Johnson
